Navigation

Situation:
One or multiple people try to navigate somewhere in traffic

Target Group:
Especially people driving a motorbike or bicycle are interesting, since they cannot use their hands while navigating for input as easy as car drivers. But of course also cars are concerned. Others are e.g. inline skaters, wheelchair users, or just walking people.

Setting:
Mostly outside on streets (but also indoor navigation is possible.)

Themes:
- Give a way overview
- Help to find the way
- Share problems occurring on the way
- Virtual reality?!

Navigation

People often try to navigate to a certain target. While doing so they can face different problems. For example a person riding a motorbike cannot mount a navigation system in a way like if going by car and thus might needs to stop when looking on a map to find his/her way to the desired destination. Maybe there are better/novel ways to help people navigate with technologies like e.g. vibration, voice in/output and others.

Notes:
